INVESTMENT STRATEGY DESCRIPTION

The Montlake Alpha Fixed Income UCITS Fund focuses on investing in a diversified portfolio of fixed income related securities with return enhancing strategies. The fund maintains an average investment grade rating at the issue level at all times. The main goal of the fund is to seek alpha through capital gains & carry. Portfolio construction is benchmark agnostic and based on a top-down diversified allocation approach. The Investment Manager allocates to a minimum of 50 positions at any given time. Fund objectives include extracting an average spread of 300 basis points all. Our approach is to select “national champions” (mainly investment grade, developed markets).

MONTHLY REVIEW

In May 2026, the fixed income market operated under a continued "higher for longer" dynamic, with the US Treasury yield curve shifting higher and bear flattening across the curve. US-Iran tensions persisted as the primary inflationary driver, though a ceasefire extension in late May provided a degree of relief and allowed Treasuries to move with cautious optimism, pulling yields back from their year-to-date highs. Headline and Core CPI accelerated to 3.8% and 2.8% respectively, reinforcing the market's expectation that the first Fed rate cut will only materialise in September 2027.

Despite the pressure from rising yields, the month was marked by a notable divergence across credit segments. AT1s were the standout performers, with the AT1 ETF returning +3.50% on a total return basis, the strongest reading across all segments. EM bonds also delivered positive total returns, +1.09% (EMB ETF), while IG corporates posted a modest +0.86% (LQD ETF). HY, by contrast, eked out only +0.44% in total return terms (HYG ETF), consistent with the broadly flat spread picture observed in the month. This dynamic is a reversal of April's pattern, where HY led the compression. The portfolio's primary upside risk has therefore remained anchored in duration. With HY and IG spreads compressed through the month, the most meaningful source of further price appreciation lies in an eventual decline in Treasury yields rather than additional credit spread tightening.

Across the month, trading activity reflected a continued relative-value driven approach, with the portfolio rotating capital actively into the most attractive opportunities available at each point in the cycle. Exposure was tactically increased across high-quality investment-grade credit including technology

issuers in the primary market, long-duration corporates, and AAA-rated mortgage-backed securities, where discounted prices and strong collateral quality offered compelling risk-adjusted return potential on a swapped basis. The portfolio also built positions in European and Swiss-franc-denominated corporate credit, taking advantage of favourable currency hedging dynamics and attractive carry on a USD-swapped basis, with several

trades executed gradually as spreads widened and prices weakened to allow for improved entry levels. Sovereign and corporate relative-value trades were also executed to improve yield and valuation characteristics while preserving overall portfolio quality. The main contributions of the month came from Financials +41bps, Corporate +27bps and Sovereign Non-US +18bps.

GLOSSARY

Sharpe Ratio: Was developed by Nobel laureate William F. Sharpe and is used to help investors understand the return of an investment compared to its risk. The ratio is the average return earned in excess of the risk-free rate per unit of volatility or total risk. Volatility is a measure of the price fluctuations of an asset or portfolio.

Sortino Ratio: Is a variation of the Sharpe ratio that differentiates harmful volatility from total overall volatility by using the asset's standard deviation of negative portfolio returns—downside deviation—instead of the total standard deviation of portfolio returns. The Sortino ratio takes an asset or portfolio's return and subtracts the risk-free rate, and then divides that amount by the asset's downside deviation. The ratio was named after Frank A. Sortino.

Vol (Volatility): Volatility measures how much an investment's price fluctuates over time. Higher volatility indicates greater price swings and potentially higher risk, while lower volatility suggests more stable performance.

bps (Basis Points): Basis points, or bps, are a unit of measurement used to describe percentage changes in interest rates or yields. One basis point equals one-hundredth of a percent (0.01%). For instance, 25 bps equals 0.25%.

SOFR (Secured Overnight Financing Rate): The Secured Overnight Financing Rate (SOFR) is a benchmark interest rate that reflects the cost of borrowing cash overnight, secured by U.S. Treasury securities. It is widely used as a replacement for LIBOR in financial markets.

Var (Value at Risk): Value at Risk (VaR) is a statistical measure that estimates the potential loss an investment or portfolio could face over a specified time period with a given level of confidence. For example, a one-day 5% VaR of \$1 million means there is a 5% chance the portfolio could lose more than \$1 million in one day. VaR is widely used for risk management.

HWM (High-Water Mark): The High-Water Mark is the highest value that an investment or fund has reached. It is commonly used in performance fee structures to ensure fees are only charged on gains above the previous peak value.

AT1: A type of regulatory capital under Basel III, issued as high-risk perpetual bonds or convertible instruments by banks to absorb losses during financial stress. Designed to ensure stability, AT1 can convert to equity or be written down if the bank's financial health declines.

Yield to Worst: Yield to Worst (YTW) is the lowest possible yield that an investor can receive on a bond without the issuer defaulting, assuming the bond is held to its earliest callable date or maturity. It accounts for scenarios such as early redemption, prepayment, or call provisions, which may result in a lower yield than the stated yield to maturity. YTW is a conservative measure used to assess potential downside risk in fixed-income investments, ensuring investors understand the minimum return they might earn.

Duration: Measures a bond's sensitivity to interest rate changes, expressed in years. It estimates how much the bond's price will change for a 1% change in interest rates, helping investors assess interest rate risk.

Spread: Refers to the difference in yield between two bonds or financial instruments, typically of different credit qualities, maturities, or risk levels. It is often used to compare corporate bonds to risk-free government bonds, indicating the extra return investors demand for taking on additional risk.

(b)- For simulated currency-hedged share classes, hedging is modeled based on the currency management framework. Forward points are derived from external market data and applied based on a quarterly hedge roll. For non-hedged share classes performance is calculated using daily spot FX conversion between the fund's base currency and the share-class currency. Estimated hedging-related costs are for hedged share classes are a 3.5 basis point annual administration fee and for non-hedged share classes, an estimated 2 basis point FX execution spread.
